The Problem: Finding Data

The Problem: Finding Data

Archives

Data portals

Mission Team Services

Where do researchers start?

Experienced researchers have some knowledge.

New Researchers could easily feel lost.

Both are in jeopardy of either

- reproducing spatial data that already exists
- or not using the best they could

Space Agencies have a similar problem

- What Planetary Spatial Data already exists?
- What must they fund to create?

How do Earth Scientists
deal with this problem?

2

Where do I **START?**

How do I find data across multiple states and groups? Can I access them?

Who can I turn to for advice and guidance?

How are data collected and published? Why are there differences?

How can I make my data integrate with other data?

Title 3—

Executive Order 12906 of April 11, 1994

The President

Coordinating Geographic Data Acquisition and Access: The National Spatial Data Infrastructure

Geographic information is critical to promote economic development, improve our stewardship of natural resources, and protect the environment. Modern technology now permits improved acquisition, distribution, and utilization of geographic (or geospatial) data and mapping. The National Performance Review has recommended that the executive branch develop, in cooperation with State, local, and tribal governments, and the private sector, a coordinated National Spatial Data Infrastructure to support public and private sector applications of geospatial data in such areas as transportation, community development, agriculture, emergency response, environmental management, and information technology.

NOW, THEREFORE, by the authority vested in me as President by the Constitution and the laws of the United States of America; and to implement

National Geospatial Data Clearinghouse

<https://www.geoplatform.gov>

Welcome to the Geospatial Platform

The GeoPlatform provides shared and trusted geospatial data, services, and applications for use by the public and by government agencies and partners to meet their mission needs.

GeoPlatform users have access to

- A one-stop shop that delivers trusted, consistent data and services
- Authoritative data to support informed decision making
- Reusable applications and services for governmental and nongovernmental use
- A shared infrastructure that can host your data and applications
- A focal point where governmental, academic, private, and public data can be visualized together to inform national and regional issues

Features & Announcements

National Geospatial Data Clearinghouse

<https://www.geoplatform.gov>

- Does not primarily archive data
- Acts as a catalog of available data sets
- Providers know that submission of their metadata benefits their work

What might a Planetary Spatial Data Clearinghouse be like?

Laura et al. (2017) define three foundational data themes for planetary spatial data:

- geodetic coordinate systems
- elevation data
- orthoimages

Imagine:
a planetary spatial data
clearinghouse
with elevation and orthoimage
information

Mars Researcher

Mars Researcher

Topography Search returns:

- MOLA gridded data products
- merged HRSC/MOLA map
- regional terrain models created for landing sites
- local terrain models created by researchers for their individual ROSES grants

Mars Researcher

Orthoimage Search returns:

- USGS MDIM products
- various USGS geologic maps
- THEMIS mosaics hosted at ASU
- local mosaics and thematic maps that were created for published papers that are being hosted by journals or universities

Planetary Spatial Data Clearinghouse

- acts as a table of contents
- allows for broader discovery than PDS searches alone
- requires curation and community involvement
- would enable planetary science research
- important piece of realizing a PSDI
